## HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

**DETAILED ACTION**

1. This office action is responsive to communication filed on August 28, 2008.

***Response to Arguments***

2. Applicant's arguments, see pages 6-8, filed August 28, 2008, with respect to claims 8-10 and 13-18 have been fully considered and are persuasive. The rejection of claims 8-10 and 13-18 has been withdrawn.

***Allowable Subject Matter***

3. Claims 8-10 and 13-18 are allowed.
4. The following is an examiner's statement of reasons for allowance:

Consider claim 8, the closest prior art, Moraillon, teaches:

A method of operating an imaging apparatus(column 2, line 42 through column 3, line 7, see figure 3), the apparatus(figure 3) including a plurality of groups of photosensors(See figure 3 for a plurality of groups of photosensors. Each group contains two green photosensors and either two red photosensors or two blue photosensors.), wherein a first subset of groups of photosensors(i.e. the green photosensors) is substantially evenly distributed along a linear array(see figure 3) and is substantially interleaved with the second subset of groups of photosensors(i.e. the red and blue photosensors) along the linear array(See figure 3.), a first output line(12S), and a second output line(13S), comprising:

in a second mode, for each of a plurality of groups of photosensors, transferring signals from a first photosensor(i.e. a first green photosensor) in the group to the first

output line(12S), and transferring signals from a second photosensor(i.e. the red or blue photosensor horizontally adjacent the green photosensor) in the group to the second output line(13S, column 2, line 61 through column 3, line 7.);

wherein, in the second mode, signals from adjacent photosensors or groups of photosensors on the first and second output lines overlap over time(column 2, lines 61-69).

Moraillon teaches that the imaging apparatus is arranged with two adjacent vertical photosensors of a group having the same color(see figure 3).

However, the prior art of record does not teach, nor reasonably suggest in a first mode, transferring signals from a first subset of groups of photosensors to the first output line, and transferring signals from a second subset of groups of photosensors to the second output line, as recited in claim 8.

Claims 9, 10, 13 and 14 are allowed as depending from claim 8.

Claim 15 is the same in scope and content as claim 8, and Moraillon once again teaches the limitations discussed above. However, the prior art of record does not teach, nor reasonably suggest the photosensors in each group being connectable in a first mode to output a single video signal for the group, with the groups in odd positions outputting to the odd video line and the groups in even positions outputting to the even video line, as recited in claim 15.

Claims 16-18 are allowed as depending from claim 15.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

### ***Conclusion***

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
6. Sakurai et al.(US 6,784,928) teaches an image sensor(figure 2) with first and second output lines(1, 2) which respectively read out odd and even columns of pixels(column 3, lines 54-67).
